**ROSE PROJECT – INTERNAL STRUCTURE MEMO**

*(For discussion only – draft)*

**1. Purpose and high-level design**

The Rose Project is structured around a Singapore Variable Capital Company (VCC) sub-fund that issues Rose Notes to investors and controls the entire Rose operating group. The design separates regulated fund activities, trading operations, and token issuance, while keeping economic risk and control consolidated at the VCC level.

**2. Fund vehicle and investment manager**

The core fund vehicle is **ROSE VCC – Rose Perpetual Strategies Sub-Fund**, which acts as the **Note Issuer**. It issues Rose Notes that embed a coupled package of long and short perpetual tokens, designed so that the package is economically delta-neutral at issuance. Namara Wealth Advisors, as licensed investment manager, manages the VCC sub-fund, including portfolio implementation, cash management, and coordination of external service providers.

Investor subscriptions and redemptions occur at the VCC level in either fiat or crypto, flowing through dedicated **bank and brokerage accounts** and a **wallet / custodian** stack shown directly under the VCC on the structure chart. These accounts are used for cash and NAV movements only; token and trading flows are routed through the operating entities.

**3. Group holding entity**

The VCC sub-fund owns **100% of Rose Holding Pte. Ltd. (Singapore)**. Rose Holding is the group holding and coordination entity and sits between the regulated VCC and the offshore operating companies. All shares in the trading and coin-issuance entities are held through Rose Holding, so legal ownership and governance flow vertically from the VCC to Rose Holding and then to each operating company.

**4. Trading operations**

Under Rose Holding, **Rose Offshore Trading Co. (Offshore – Jurisdiction 1)** is the dedicated trading engine. It runs ARP and perpetual futures strategies across centralised and decentralised exchanges (CEX and DEX), and manages treasury and FX exposures. The Trading Co. maintains its own **bank and brokerage accounts** and **exchange accounts (CEX / DEX / on-chain)**, which are used to deploy capital, manage margin, and execute strategies. Profits and losses ultimately accrue to the VCC via its equity ownership in Rose Holding and, indirectly, in the Trading Co.

Crypto and token flows between the VCC and the Trading Co. (red dashed arrows on the chart) represent the movement of coupled token packages used as collateral, hedging instruments, or liquidity inventory. These flows are operational in nature and do not change legal ownership of the underlying entities.

### 5. Coin issuance and coupled tokens

**Rose Coin Issuer Co. (Offshore – Jurisdiction 2)** is responsible for the issuance and lifecycle management of the project's synthetic tokens. It **issues coupled long and short perpetual tokens (L-Token / S-Token)**, manages the **coin treasury**, and provides **on-chain liquidity** via dedicated wallets and DEX liquidity pools.

Tokens are always minted as **paired units**: one L-Token and one S-Token at the same notional exposure. When these pairs are embedded into Rose Notes at the VCC level, they are treated as a **single coupled package** whose long and short legs offset each other. This design is intended so that, at issuance, the Note's embedded token position is market-neutral on the underlying asset, with directional risk arising only from the trading strategy rather than from the existence of the tokens themselves.

The same coupled packages can be placed under the management of the Trading Co. for use in hedging, collateralisation, and market-making. Even when a package is operationally deployed within Trading Co., it is viewed from the VCC's perspective as an intact L+S unit; flows on the chart between VCC, Coin Issuer, Trading Co., and external venues therefore refer to movement of **whole packages**, not free-standing long or short legs.

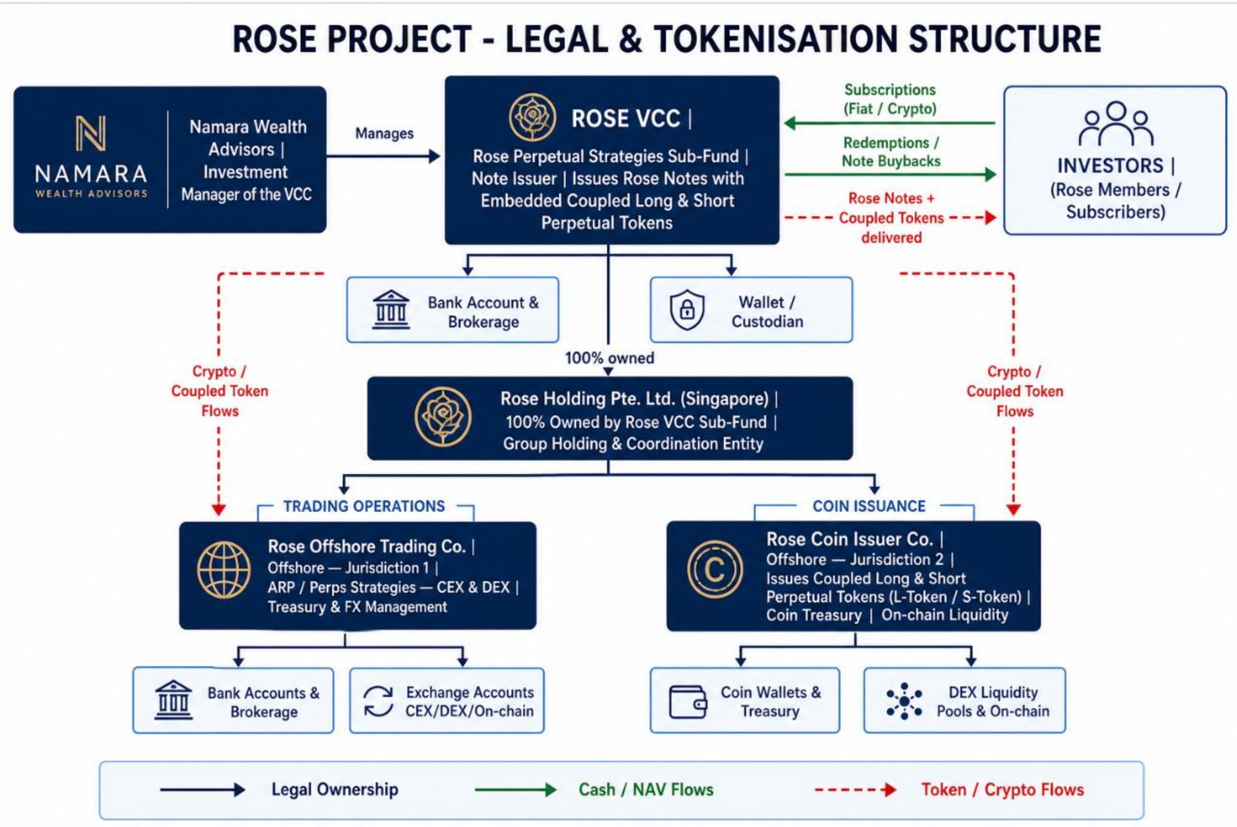
### 6. Flow conventions on the structure chart

The **Rose Project – Legal & Tokenisation Structure** diagram should be read using the following conventions:

- **Solid navy arrows – Legal ownership**
  Show equity ownership and control, which runs from the VCC to Rose Holding and onward to the Trading Co. and Coin Issuer Co., and then down into the various account and wallet structures.
- **Green arrows – Cash / NAV flows**
  Show subscriptions and redemptions between investors and the VCC, as well as internal movements of cash, NAV, and fees across bank and brokerage accounts within the group.
- **Red dashed arrows – Token / crypto flows**
  Show movement of crypto, coupled token packages, and on-chain positions

between the VCC, Coin Issuer Co., Trading Co., and external trading or liquidity venues. These flows are operational and do not themselves alter equity ownership.

This memo is intended to support internal discussion of the Rose structure and should be read together with the GRAPH below , which visually reflects the entities, relationships, and flow types described above



The Laplace group already operates a structure that closely mirrors the Rose set-up, with **Laplace AM** acting as the VCC-based issuance platform and sole subscriber to the VCC sub-fund in the legal and operational diagram. This VCC already has the capability to issue tokenised notes, which are made available to sophisticated clients through the Laplace digital marketplace at **laplace.digital**, leveraging smart-contract tokenisation to package investment strategies into transferable tokens. However, the current platform stack requires an upgrade to align with the next wave of tokenised products, improve user experience, and integrate more robust trading, reporting, and compliance workflows around these tokenised notes.
